DETAILED ACTION

Allowable Subject Matter

Claims 1-22, 25-26, and 32-35 are allowed.

The following is an examiner's statement of reasons for allowance: The present invention is directed to a method, system and device for encrypting communications. Independent claims 1, 21, and 32 each recite the uniquely distinct features of "an encryption information determination step of selecting an encryption algorithm from among a plurality of previously provided encryption algorithms, the selected encryption algorithm being different depending on a predicted total used resource or an actual total used resource". Independent claim 25 recites the uniquely distinct features of "an encryption information determination section for selecting an encryption algorithm from among a plurality of previously provided encryption algorithms, the selected encryption algorithm being different depending on an encryption algorithm or encryption algorithms used for one or more packets received from a communication counterpart; wherein the encryption information determination section includes an encryption algorithm statistics table for storing the encryption algorithm or encryption algorithms used for the one or more packets received from the communication counterpart, and selects an encryption algorithm appearing with a highest frequency among the encryption algorithm or encryption algorithms used for the received one or more packets by referring to the encryption algorithm statistics table". Independent claim 26 recites the uniquely distinct features of "an encryption information determination section for selecting an encryption

algorithm from among a plurality of previously provided encryption algorithms, the selected encryption algorithm being different depending on an encryption algorithm or encryption algorithms used for one or more packets received from a communication counterpart; wherein the encryption information determination section includes an encryption algorithm statistics table for storing the encryption algorithm or encryption algorithms used for the one or more packets received from the communication counterpart, and an encryption process and used-resource table for storing information concerning an encryption strength and a calculation amount of each of the previously provided encryption algorithms, and selects an encryption algorithm having a highest encryption strength among those encryption algorithms whose calculation amounts are equal to or less than a statistical value derived from the calculation amounts of the encryption algorithms used for the received packets, by referring to the encryption algorithm statistics table and the encryption process and used-resource table". The closest prior art, Jardin (US 6,671,810) discloses a method for randomly selecting a security algorithm for establishing secure communications over a computer network fails to anticipate or render the above underlined limitation obvious.

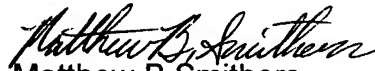

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
